

Hubis Recent Uploads Script (quick and dirty guide)

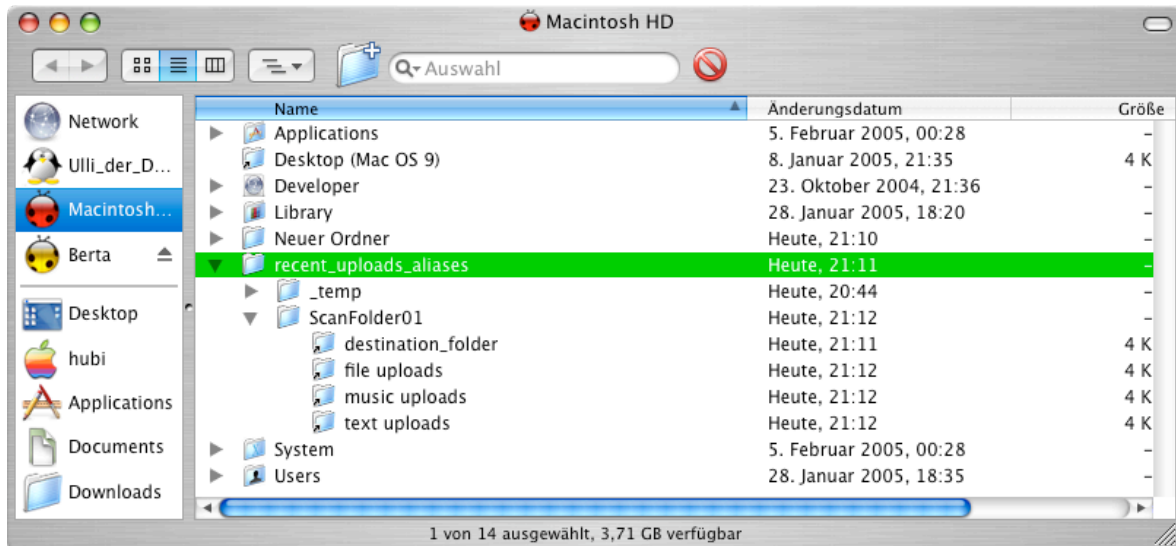

run the script the first time, this should create these folders on your startup disk

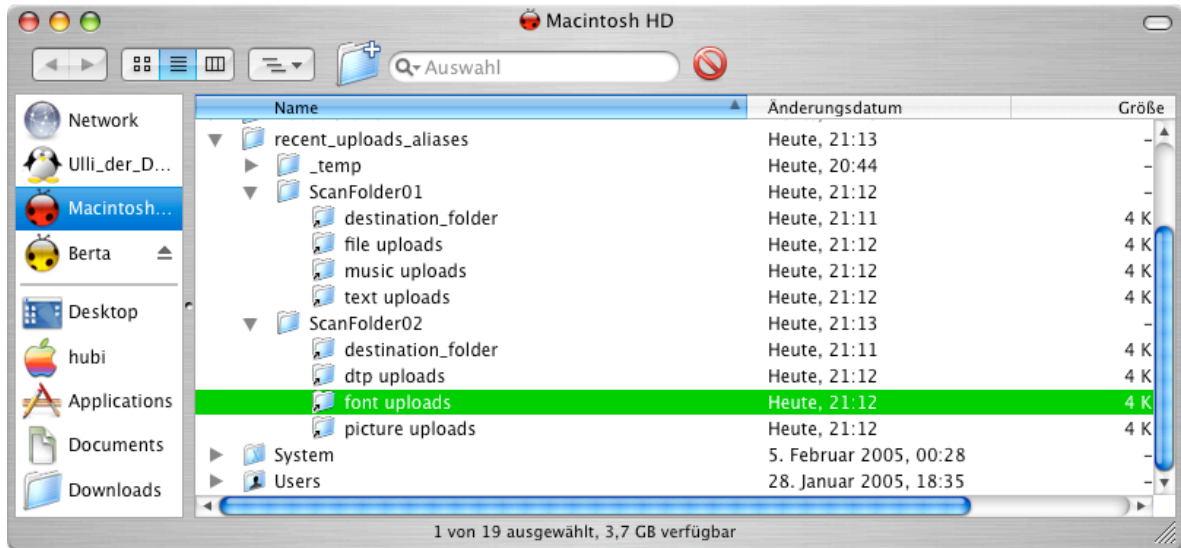

now create a new folder in 'recent_uploads_aliases' (name does not matter)

then place an alias within this new folder call 'destination_folder' to the directory in which the alias of the recent uploads should be stored in **(WARNING, everytime the script starts, all files within this destination directory (hopefully only aliases) are deleted!!!)** and then add alias to the upload folders which should be scanned...

looks like this:

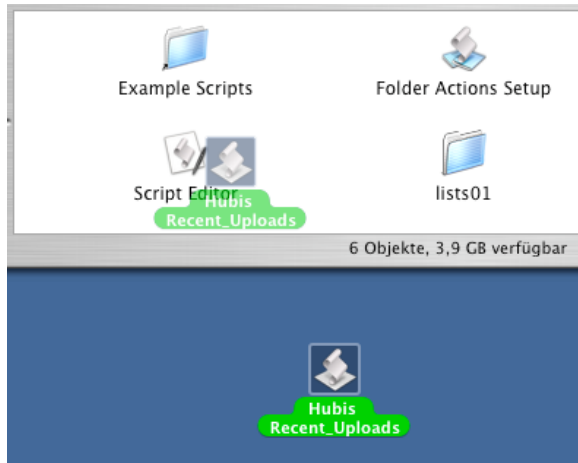

if you want several recent upload folder (containing different recent uploads):

now run the script an see how it works...

if you want to change how old the recent uploads may be (4 days is preset) open the script with applescript editor (drag & drop)

and change the daycount value to whatever you like =)
